## **Multivariate Regression | Examples of Multivariate Regression**

In statistical modeling, regression analysis is a set of statistical processes for estimating the relationships between a dependent variable (often called the 'outcome variable') and one or more independent variables (often called 'predictors', 'covariates', or 'features'). The most common form of regression analysis is linear regression, in which a researcher finds the line (or a more complex ...

## **Introduction to Multivariate Regression Analysis**

Multivariate regression is an extension of simple linear regression. It is used when we want to predict the value of a variable based on the value of two or more different variables. The variable we want to predict is called the Dependent Variable, while those used to calculate the dependent variable are termed as Independent Variables.

Unfortunately multivariable regression is often mistakenly called multivariate regression, or vice versa. Multivariate regression is any regression model in which there is more than one outcome variable. In the more usual case where there is just one outcome variable, this is also known as univariate regression. Thus we can have: univariate ...
