The channel coding refers to the class of signal transformations designed to improve communications performance by enabling the transmitted signals to better with-stand the effects of various channel impairments, such as noise, interference and fading. The channel coding is considered as an important signal processing

## **Different Channel Coding Techniques In 4G Wireless ...**

Channel coding can be either error detection coding or error correction coding. When only error detection coding is employed, the receiver can request a transmission repeat, and this technique is known as automatic repeat request (ARQ). This requires two-way communications.

## **Channel coding (Chapter 15) - Wireless Communication Systems**

Wireless communication systems depend on channel coding (sometimes called forward error correction) to ensure that the data received is the same as the data sent. Wireless links suffer from interference and fading which causes errors, so to overcome this the transmitter adds additional information before the data is sent.

Channel coding improves mobile communication link performance by adding redundant data bits in the transmitted message. At the baseband portion of the transmitter, a channel coder maps a digital message sequence in to another specific code sequence containing greater number of bits than original contained in the message.

Channel coding techniques used in 5G NR (New Radio) are different than used in LTE. LDPC is replacing Turbo coding which is used in PDSCH channel where as Polar coding is replacing TBCC (Tail Biting Convolutional Codes) used in PDCCH channel. Repetition/block coding is used for very small block lengths of data.

One of the techniques that has been utilized in the IEEE 802.16m channel coding and HARQ-IR transmission is constellation rearrangement. The effect of constellation rearrangement on the coding and HARQ performance at link-level has been evaluated and is shown in Figures 9-56 and 9-57, for downlink and uplink, respectively.
