Combustion is the most common technique for controlling and treating landfill gas. Combustion technologies such as flares, incinerators, boilers, gas turbines, and internal combustion engines thermally destroy the compounds in landfill gas. Over 98% destruction of organic compounds is typically achieved.

ATSDR - Landfill Gas Primer - Chapter 5: Landfill Gas ...

Two basic methods of land disposal include landfilling and underground injection. Prior to land disposal, surface storage or containment systems are often employed as a temporary method. Temporary on-site waste storage facilities include open waste piles and ponds or lagoons.

Leachate collection and removal systems—sit on top of the composite liner and removes leachate from the landfill for treatment and disposal. Operating practices—include compacting and covering waste frequently with several inches of soil. These practices help reduce odor, control litter, insects, and rodents, and protect public health.

Landfill leachate has also been effectively treated by the rotating biological contactor (RBC) process. The RBC is a biological process consisting of a large disk with radial and concentric passages slowly rotating in a concrete tank. During the rotation, about 40 percent of the media surface area is in the wastewater.

This EM provides information about the design of systems to monitor, collect, transport, and treat gas from municipal, industrial and hazardous waste landfills. The EM describes various landfill gas (LFG) emission control techniques and presents design procedures relative to each. The following topics are discussed in this EM: a.

Landfill Gas Collection and Treatment Systems

A portion gets recirculated back into the landfill vs. being treated. However, there are many cases where it is collected and comingled with leachate for treatment or disposal. Our pioneering breakthroughs come from a holistic approach, which uses the landfill itself as an asset in leachate management.
