The author discusses the relation between maternal dietary deficiencies during pregnancy and the formation of the child's dental tissues. He doubts if the formative cells of the permanent teeth are affected by maternal influences, save in the transmission of infections and hereditary variations. Whilst he recognizes that some calcification of the deciduous teeth takes place during the child's...

### **Foods and Feeding as they affect Teeth and their Environment.**

The environment present in the human mouth is suited to the growth of characteristic microorganisms found there. It provides a source of water and nutrients, as well as a moderate temperature. [2] Resident microbes of the mouth adhere to the teeth and gums to resist mechanical flushing from the mouth to stomach where acid-sensitive microbes are destroyed by hydrochloric acid .

### **Oral microbiology - Wikipedia**

So our teeth evolved for tough foods in an abrasive environment, and our soft, clean diet has upset the balance between tooth size and jaw length. Hence the assembly line at the oral surgeon's ...

"The changes in the teeth are just slightly behind the environment and dietary trends, which is very consistent with the hypothesis of adaptation," Muhlbachler said. After this, tooth height...

### **From the Horse's Mouth: Teeth Reveal Evolution | Live Science**

After being diagnosed with and recovering from COVID-19, people are sharing stories of how their teeth or gums weakened, with some saying that their teeth became discolored, broke or fell out. It's too soon to confirm a clear, well-established link between the coronavirus and oral health, and doctors will need much more data to figure out precisely what's happening.
